

CAPILLARY COLUMNS

simply Quality

GREYHOUND - *setting the standard*

As a trusted name in the supply of chromatography consumables and certified reference standards, Greyhound also offers a comprehensive selection of top quality own brand Capillary columns, SPE columns, HPLC columns and Certified syringe filters.

This catalogue contains details of the Q-Cap range of Capillary Columns. Other product catalogues are available on request.

These quality products are backed by the guaranteed reliability and technical support which has become synonymous with the name Greyhound. Visit our website at: www.greyhoundchrom.com

Welcome to a new era in analyte detection and column performance.

GREYHOUND CHROMATOGRAPHY Q-CAP CAPILLARY COLUMNS

Our extensive range of capillary columns are designed and manufactured to the most exacting and rigorous standards. Materials of the highest quality and attention to every detail of the manufacturing process, results in columns which ensure excellent and reproducible performance for even the most difficult types of samples.

Every stage of the manufacturing process, from the inertness of the highest quality fused silica tubing, the phase coating efficiency, film thickness, selectivity and low bleed characteristics of every column are all rigidly monitored. This attention to every details of the manufacturing process means you can be sure the column you purchase today will give you the same precise results as the one you purchased last year or will purchase next year.

Highest Quality Column Specifications

All Q-Cap capillary columns are manufactured under strict ISO 9001:2000 certified quality procedures, thus ensuring consistent reproducibility column after column. Every Q-Cap capillary column is individually tested to meet the most demanding performance standards, the results of which are detailed in the columns test report and installation guide.

Low Bleed

The bleed level of a column is a measure of its stability. It is directly related to the amount of stationary phase in the column and thus the film thickness. It also increases exponentially with temperature. Greyhound Chromatography Q-Cap low bleed columns have longer column lives and enable analysts to work with the latest high sensitivity detectors resulting in less instrument maintenance whilst ensuring quantification of high boiling point and high molecular weight compounds which are analysed by means of high temperature gradients.

Efficiency

Column efficiency is a measure of its separating power. Narrow bore columns, which have a high number of plates per meter have higher separation powers.

This results in better resolution between two peaks or can reduce analysis time. Q-Cap capillary columns are available in diameters from 0.1mm to 0.53mmID.

Inertness

The columns inertness will influence the elution and recovery of active (polar) compounds. Peak shape for more acid-base compounds improves the closer the value is to 1.0, resulting in greater quantification of peaks and more accurate and reliable results.

Column-to-Column Reproducibility

The selectivity of a column is measured by its Retention Index (RI) and indicates the elution order of the compounds being analysed. The precision manufacturing processes of all Q-Cap capillary columns ensures that the RI between them is as low as possible resulting in excellent column-to-column reproducibility.

Phase Ratio

A measure of the analytes retention time which varies according to the film thickness of the phase on the column. Columns with a small variance in phase ratio have better column to column retention time reproducibility.

www.greyhoundchrom.com

Maximum Operating Temperature

The MAOT (Maximum Allowable Operating Temperature) of a stationary phase is the temperature at which it will continue to function optimally. MAOT details are listed against each column in the catalogue. Thick film coatings have a lower MAOT because they bleed more at higher temperatures. For temperature programmed analysis, the MAOT is usually 20-25°C. higher than for isothermal operation.

Technical Support

Our reputation and ability for providing technical support and solutions to problems in all key areas of chromatography is well known. If you have any questions we can assist you with simply give us a call.

HOW TO SELECT THE RIGHT CAPILLARY COLUMN

Greyhound Chromatography offers more than 1000 different capillary columns and it can be difficult to decide on the most suitable column for your application. The following pages are a guide to the various factors which should be taken into consideration when selecting the right column.

Column Tubing - Fused Silica or Metal?

All Q-CAP fused silica and stainless steel column tubings provide a very high level of inertness and flexibility. Fused silica is the most popular choice of tubing and produces the best column coating efficiency, resulting in better resolution of compounds which elute close together. In harsh operating conditions, e.g. field sampling or high temperature analysis, stainless steel columns (SilCol) are ideal, they resist breakage from abrasion with virtually no risk of damage in the GC even at elevated temperatures.

Stationary Phase Selection

Selecting the most suitable stationary phase for the column will depend on the kind of compounds to be separated. Non polar phases such as GC-1 and GC-5 separate compounds by boiling point.

Intermediate polarity phases such as GC-1301 or GC-1701 combine retention by boiling point with the more selective interaction through hydrogen bridges or dipolar moments etc and thus provide higher selectivity.

The principal mechanisms of polar phases such as GC-2340 (Cyanosilicone with 100% of cyanopropyl groups) lie in the dipole-dipole interactions between the functional groups of the stationary phase and those from the substances to be separated. These types of phases retain polar compounds more than non polar ones.

In general, non polar phases are more thermally stable than the polar phases. In other words the higher the column polarity, the lower its thermal stability. Most Q-cap columns are cross-linked, which result in high thermal stability. Cross-linking of the stationary phase produces slight changes in the physiochemical characteristics of the phase as well as in its polarity relative to the uncross-linked phase. Thus we also offer columns with non bonded phases which show the selectivity of the original phase (e.g. GC-SE30, GC-SE54, GC-20M etc.). The table on the pages 6-7 details the chemical structures of the various phases used in the manufacture of Greyhound Chromatography 'Q-cap' Capillary Columns.

PLOT (*Porous Layer Open Tubular*) columns are used for the separation of compounds which are gases when at room temperature. Greyhound Chromatography offers an extensive selection of PLOT columns for the analysis of volatile polar compounds, fixed gases, low molecular weight hydrocarbons and reactive analytes e.g. sulfur gases, hydrides and amines.

Column Length

Capillary columns are manufactured in lengths from 10 to 150 meters. Most separations are carried out on columns of 25 to 30 meters in length. These columns offer the highest efficiency with relatively short analysis times. 15 meter columns are used for control analysis, reaction monitoring etc. and for the analysis of high molecular weight substances. Columns of 50 to 60 meters, 100 meters and even 150 meters are used for very complex samples. Greyhound also produce a 150 meter column for the detailed analysis of petroleum and essential oil hydrocarbons.

HOW TO SELECT THE RIGHT CAPILLARY COLUMN - *continued*

Generally, the number of theoretical plates and analysis time are directly proportional to the columns length, while resolution is directly proportional to the square root of the theoretical plates. It is important therefore, to take into account that when we double the length of the column, its resolution only increases by 40%, but analysis time increases by 100%.

Internal diameter

The columns internal diameter is inversely proportional to its separating power. The smaller the diameter, the greater the efficiency but the loading capacity decreases. For samples containing a large number of analytes requiring a column with a high resolution capability, it is recommended to use columns with a small internal diameter, (typically 0.18 to 0.25mm).

For samples with a high range of concentrations, columns with larger internal diameters are recommended (typically 0.32 to 0.53mm) as these larger diameters allow for the injection of a larger sample volume.

0.53mm ID columns have a loading capacity similar to that of packed columns, which they have replaced in many analyses, giving better resolution, greater chemical inertness and reduced analysis time.

0.32-0.53mm ID columns can be used with either the injector for capillary columns or with the packed column injector, due to the high flow-rates at which they can operate.

In GC-MS systems, it is recommended to work with small ID columns (0.10mm, 0.15mm, 0.18mm, 0.20mm and 0.22mm) so as not to exceed the capacity of the vacuum system. The latest 0.10mm ID capillary columns generate high plate numbers resulting in reduced analysis times without loss of resolution. The high efficiencies of these columns (typically 7000 to 10000 plates/meter), facilitate the rapid resolution of complex samples using shorter column lengths, with significantly reduced laboratory costs.

Film Thickness

Film thickness directly affects the columns retention time and the elution temperature of each analyte. The film thickness of the stationary phase deposited inside the column exerts an influence on the number of effective theoretical plates which can be obtained with the column for a given separation, on its loading capacity, bleed level and on the elution temperature of an analyte.

A film thickness of 0.25 to 0.32 μ m is the standard thickness allowing for a compromise between loading capacity and resolution and for the injection of samples with a wide volatility range.

Thick films increase retention of the most volatile components, whereas thin films provide faster elution at lower temperatures. Generally, thin films (0.1 μ m) should be used for compounds with a high molecular weight such as triglycerides, antioxidants etc., which have elution temperatures over 300°C. Thick films should be used for low boiling analytes, because thick films increase the interaction between the analyte and the stationary phase. Specifically, 3 to 5 μ m films are used to separate solvents, gases and very volatile substances at room temperature or lower.

When the thickness of the stationary phase increases, thermal stability decreases and the bleed level is elevated, limiting the maximum operating temperature of the column.

The β factor defines the relation between the columns

internal diameter and the thickness of the stationary phase, similar β factors will result in the same or very similar retention times and capacity factors. This implies taking into account the columns loading capacity (phase thickness and internal diameter).

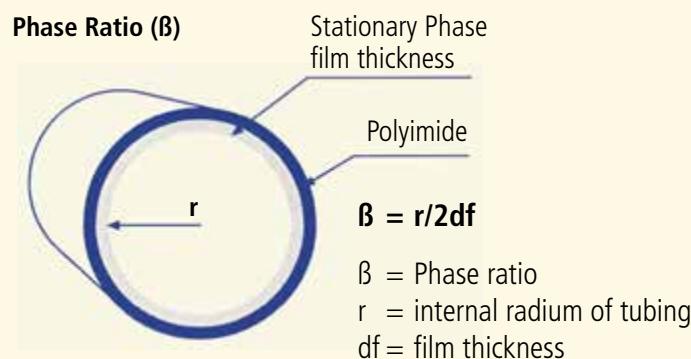

Phase Ratio (β) Value for common column dimensions *

Column ID Film Thickness (m)

	0.10	0.25	0.50	1.0	1.5	3.0	5.0
0.18mm	450	180	90	45	30	15	9
0.25mm	625	250	125	63	42	21	13
0.32mm	800	320	160	80	53	27	16
0.50mm	1325	530	265	128	88	43	27

Phase Ratio (β)

Phase Ratio (β) Value for common column dimensions *

Factor β

β Column suitable for the separation of:

>400	High molecular weight compounds
100 - 400	All purpose use
<100	Volatile compounds of low molecular weight

Column Operating Temperatures

GC-5MS	ID (mm)	df (m)	Temp. Limits
	0.20	0.33	-60 to 325-350°C
	0.25	0.25	-60 to 325-350°C
	0.32	1.00	-60 to 325-350°C
	0.53	1.50	-60 to 325-350°C

Every 'Q-Cap' Capillary Column has published maximum and minimum operating temperatures which advises the working limits for the stationary phase. These ranges vary according to the thickness of the phase coating.

Many phases state two maximum operating temperatures. The first is the maximum isothermal operating temperature. The second temperature is the maximum operating temperature under temperature-programmed conditions, when the column can be operated at this higher temperature for short periods during the analysis.

If only one temperature is listed, this is the maximum temperature for both isothermal and temperature programmed analysis.

The minimum operating temperature is the lowest usable temperature at which the column can be used, below this temperature the columns phase solidifies resulting in poor chromatographic results.

Gas-Solid (PLOT) Columns

PLOT (Porous Layer Open Tubular) columns are used for separating very volatile solutes (usually gases) without the requirement for cryogenic or sub-ambient cooling of the oven. PLOT columns will comfortably perform separations at temperatures above 35°C. which would otherwise require column temperatures below 35°C. Using thick film capillary columns.

The stationary phases in PLOT columns are physically different to the polysiloxanes and polyethylene glycols used in coated capillary columns.

Gas-solid stationary phases are tiny, porous particles which adhere to the columns inner wall using a binder or similar process. Solutes are separated dependent on their adsorption properties, and because the particles are porous, size and shape differentiation will also occur. For details on our range of PLOT columns please refer to page 57.

Custom Column Requirements

Occasionally the exact column for your analysis is not available as a standard column – THIS IS NOT A PROBLEM! We can manufacture the exact column you require, to your specifications - Length, ID, Phase and Film Thickness. Simply call us to discuss your requirements and you will have your custom column in record time.

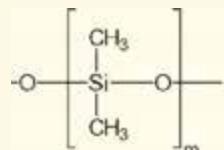

Q-Cap CAPILLARY COLUMN STATIONARY PHASES

Structures, Properties and Uses

GC-1 / GC-1ms

100% poly(dimethyl)siloxane

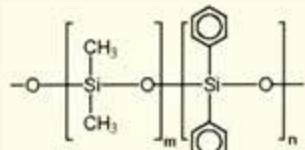

Polarity: non polar

Uses: waxes, solvents, petroleum products, pharmaceuticals

USP: G1, G2, G38

GC-5 / GC-5ms

95% dimethyl / 5% diphenyl polysiloxane

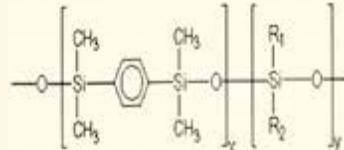

Polarity: non polar

Uses: environmental, flavours, aromatic hydrocarbons

USP: G27, G36

GC-X5ms

silphenylene phase proprietary

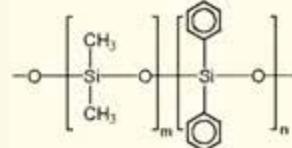

Polarity: non polar

Uses: environmental, flavours PCBs, pesticides,

GC-20

80% dimethyl / 20% diphenyl polysiloxane

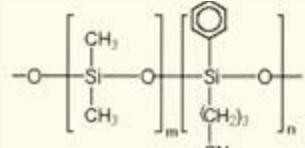

Polarity: medium polarity

Uses: environmental, flavours, aromatic hydrocarbons

USP: G28, G32

GC-1301 / GC-624

94% dimethyl
(6%) cyanopropylphenyl polysiloxane

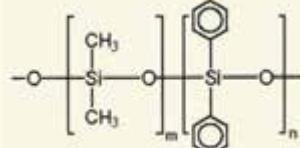

Polarity: intermediate polarity

Uses: volatiles, insecticides, pharmaceutical residue solvents

USP: G43

GC-35

35% diphenyl
65% dimethyl polysiloxane

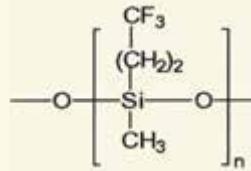

Polarity: intermediate polarity

Uses: Alcohols, pesticides, PCBs, oxygenates

USP: G42

GC-200

50% Trifluoropropyl
50% Methyl polysiloxane

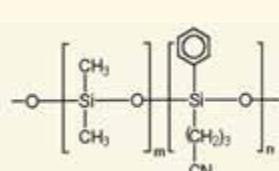

Polarity: Highly polar

Uses: Fluorocarbons, alcohols, silanes, EPA 609 & 8140

USP: G6

GC-225

50% Cyanopropylphenyl
50% dimethyl polysiloxane

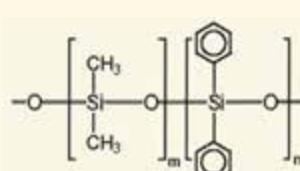

Polarity: intermediate polarity

Uses: Alcohols, pesticides, PCBs, oxygenates

USP: G19

GC-50

50% diphenyl
50% dimethyl polysiloxane

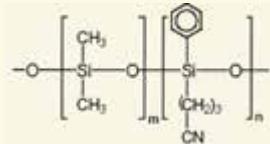

Polarity: intermediate polarity

Uses: steroids, phenols, triglycerides, phthalate esters

USP: G3

GC-1701

14% Cyanopropylphenyl
86% dimethyl polysiloxane

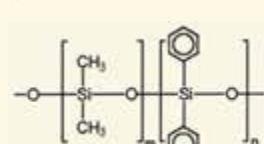

Polarity: intermediate polarity

Uses: Alcohols, pesticides,
PCBs, oxygenates

USP: G46

GC-13

86% dimethyl / 14% diphenyl
polysiloxane

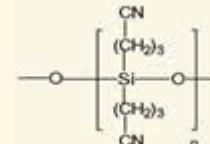

Polarity: intermediate polarity

Uses: environmental, flavours,
aromatic hydrocarbons

GC-2340

100% Cyanopropyl polysiloxane

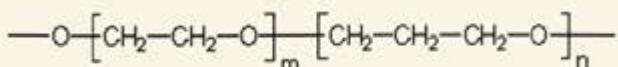

Polarity: very high polarity

Uses: FAMEs and cis-trans
isomers of FAMEs

USP: G5

GC-PAG

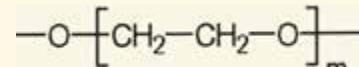

50% Polyethylene
50% Polypropylene glycol

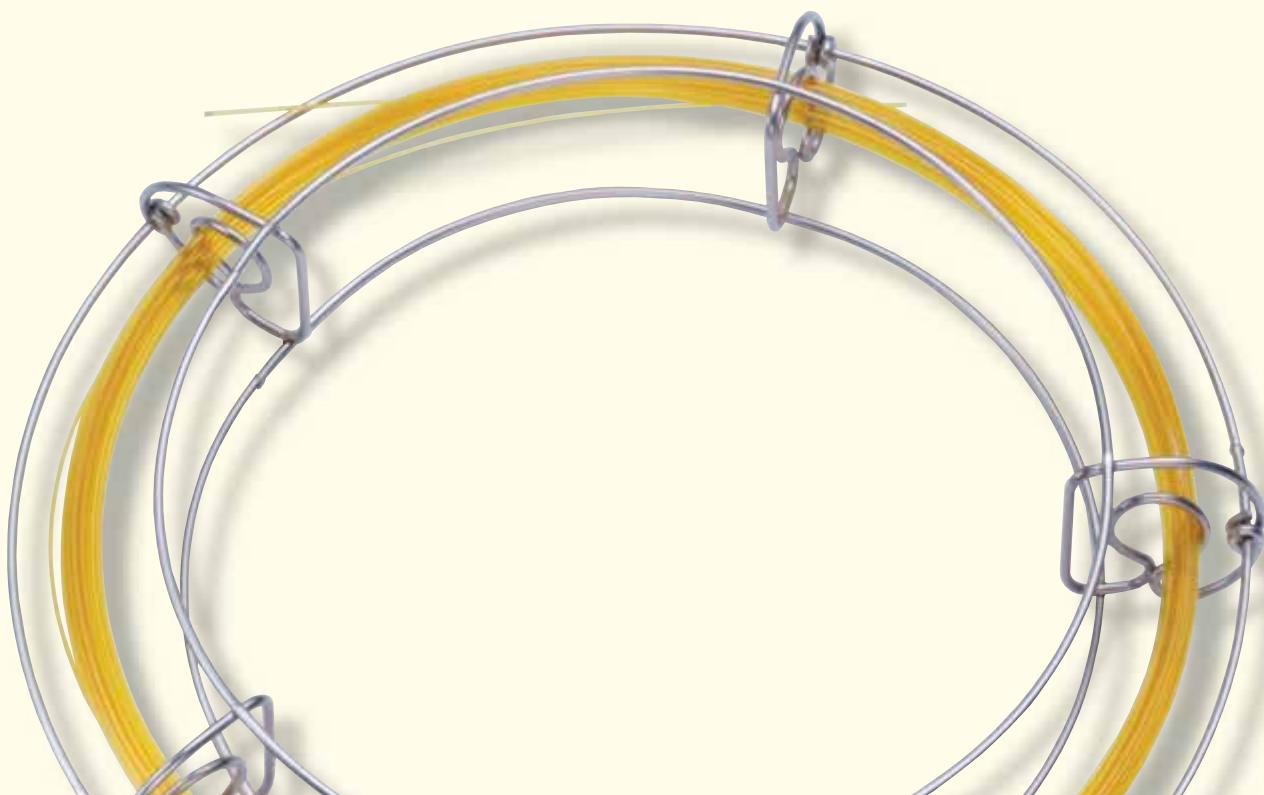

Polarity: Slightly lower than GC-WAX Similar
to UCON phases

GC-WAX

100% Polyethylene glycol

Polarity: Highly polar
Uses: FAMEs, alcohols, aldehydes, ketones aromatic isomers
USP: G14, G15, G16, G20, G39

GC-1

100% Dimethyl polysiloxane

- Bonded and cross-linked phase
- Non-polar
- Long lifetime
- Very low bleed at high temperatures
- General purpose column, suitable for a wide range of applications including solvent impurities, PCBs, arochlors, drugs of abuse, gases, sulphur compounds, essential oils, hydrocarbons, semi-volatiles, pesticides, oxygenates.
- High thermal stability

GC-1ht

- 100% Dimethyl polysiloxane
- Bonded and cross-linked phase
- Non-polar
- Specially developed for high temperature analyses (Max. temp. 400°C)
- Ideal for analysis of high boiling point compounds, triglycerides, waxes, crude oils etc.
- Better peak detection at lower concentrations
- High thermal stability

Oven: 50°C (2 min) @ 15°C

Detector: FID, 390°C

GC-SimDist

100% Dimethyl polysiloxane

- Bonded and cross-linked phase
- Maximum temperature 430°C.
- Low bleed at 400°C.
- Distillation range C6 to C120
- Conforms to ASTM Method D-2887
- Available in fused silica and SilCol Metal tubing

GC-1MS

100% Dimethyl polysiloxane

- Bonded and cross-linked phase
- Non-polar
- These columns have a selectivity identical to GC-1 and fulfill column bleed specifications which make them compatible with the analysis of trace components using GC/MS
- Excellent chemical inertness towards active constituents
- High thermal stability
- Improved signal-to-noise ratio enabling greater sensitivity to be obtained with the MS, ECD, NPD, SCD, etc. detectors and greater precision in quantitative analysis at trace levels
- Low column bleed means less detector contamination and greater speed in conditioning columns
- Ideal for environmental, food and fragrance, petrochemical and pharmaceutical analysis

GC-1 PONA

100% Dimethyl polysiloxane

- Bonded and cross-linked phase
- Non-polar
- Designed for the complete analysis of PONA hydrocarbons (P-Paraffins, O-Olefins, N-Naphthenes and A-Aromatics) in petrol-derived products according to the ASTM regulations, method D5134

GC-1 PONA. Similar Phases

Agilent: HP-PONA

Restek: Rtx-1 PONA

GC-5

(95%) Dimethyl - (5%) diphenylpolysiloxane

- Bonded and cross-linked phase
- Non-polar
- High efficiency, long column lifetime
- The most versatile and universal stationary phase in the field of gas chromatography analysis.
- The low percentage of phenyl in the polymer structure gives it a characteristic affinity towards compounds with aromatic rings. GC-5 is the most popular phase due to its great thermal stability and chemical inertness and is the stationary phase of choice for most types of analysis
- Allows the analysis of acidic and basic compounds
- Ideal for environmental analysis e.g. dioxins, PCBs, PCTs, polyaromatic compounds, phenols, herbicides, organochlorine and organophosphorus pesticides, aromatic hydrocarbons, solvents, drugs, oils, etc...

GC-5ht

(95%) Dimethyl - (5%) diphenylpolysiloxane

- Bonded and cross-linked phase
- Non Polar
- Produced specially for analysis at high temperature up to 400°C
- Fused silica tube covered with polyimide, resistant to high temperatures
- Excellent symmetry and rapid elution times for high boiling compounds
- Ideal for the analysis of waxes, triglycerides, sterol esters, polyoxyethyleneated alcohols etc

ID (mm)	Length (m)	Film (μm)	Temp Limits (°C)	Cat. No.

 P/N 10-200450
 Carrier: H₂, 6psi (41,3 kPa)
 Oven: 150°C to 380°C (10 min.) @ 30°C/min.
 Injection: 1 μL (Irganox 1010, 12mg/ml chloroform), split (1:60), 370

GC-Sterol

(95%) Dimethyl - (5%) diphenylpolysiloxane

- Bonded and cross-linked phase
- Non-polar
- Specifically designed for the analysis of complex mixtures of sterols, from either animal or plant origin
- Special deactivation of the capillary tube wall guarantees a high chemical inertness, low bleed level and permits the analysis of sterols without derivatization
- Column is specifically tested for analysis of sterols

ID (mm)	Length (m)	Film (μm)	Temp Limits (°C)	Cat. No.

GC-5MS

(95%) Dimethyl - (5%) diphenylpolysiloxane

- Bonded and cross-linked phase
- Non Polar
- GC-5MS columns use the same stationary phase as GC-5, but the polymer synthesis process, the capillary deactivation technique and the bonding and cross-linking procedures have been optimized to obtain the minimum possible bleed level and an exceptional chemical inertness
- Column recommended to work with any selective detector
- The ultra-low bleed and high chemical inertness of GC-5MS columns allows for a better signal-to-noise ratio (higher sensitivity level), and therefore better detection and quantification of sample components at low concentrations.
- Ultra-low bleed makes these columns ideal for GC/MS
- Suitable for a wide variety of analysis, including drugs, solvent impurities, pesticides, PCB congeners, arochlors, hydrocarbons, semi-volatiles and essential oils.

GC5-MS columns have excellent resolution and symmetry throughout their polarity range, for neutral, acidic and basic compounds. All these substances which appear in the analysis of semivolatile traces (for example EPA official methods) can be analyzed on just one column.

TEST Mix 5

Column: GC-5ms

30m x 0.25mm x 0.25 μ m

P/N 10-200504

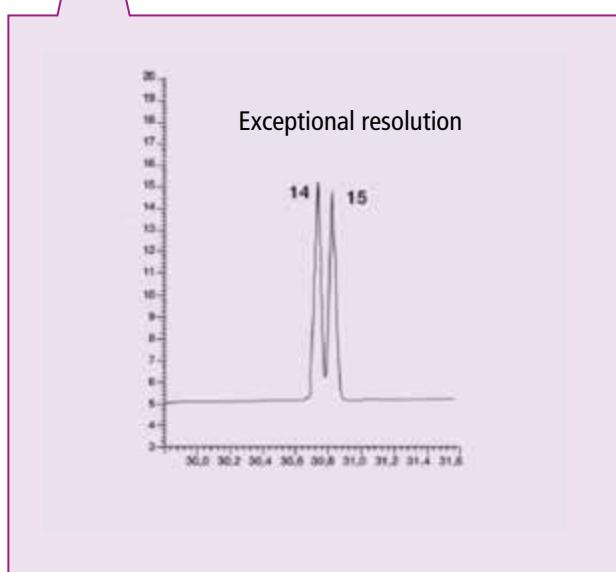

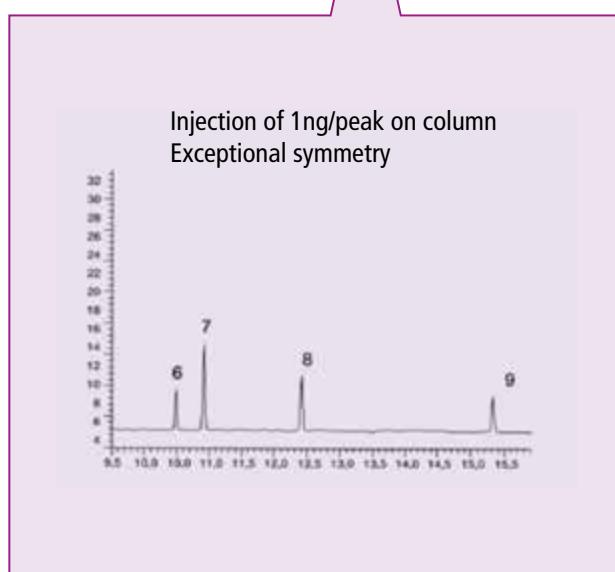

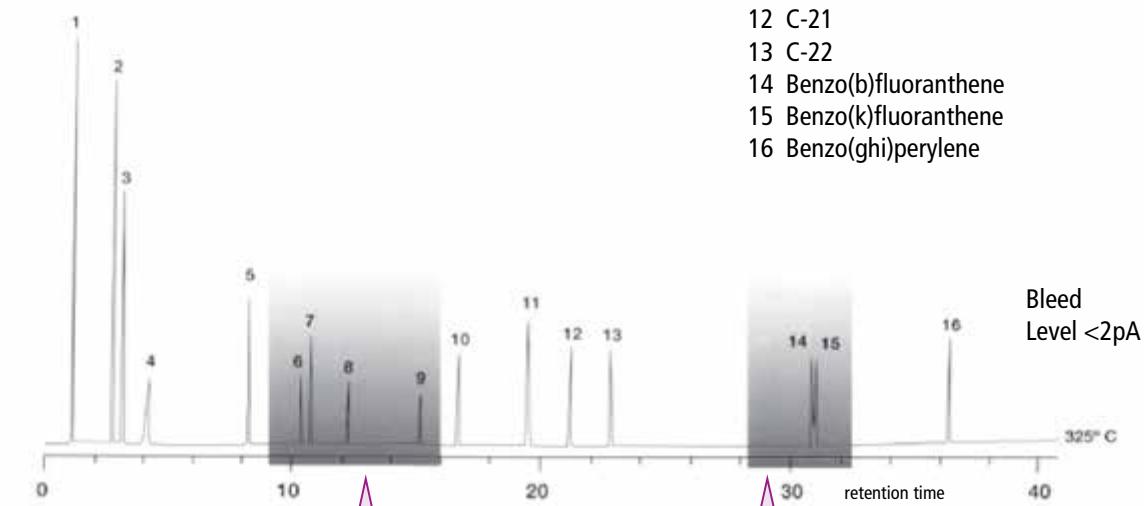

Carrier: H₂, 12psi (87.7 kPa)

Oven: 100°C to 325°C (5 min.) @ 6°C/min

Injection: 1 μ L split (1:100), 5 to 10 ng/comp. on column, 280°C.

Detector: FID, 300°C

- 1 Methylene chloride
- 2 1,2-Hexanediol
- 3 Nitroso-di-n-propylamine
- 4 Benzoic acid
- 5 C-14
- 6 2,4-Dinitrophenol
- 7 4-Nitrophenol
- 8 4-Nitroaniline
- 9 Pentachlorophenol
- 10 Carbazole
- 11 C-20
- 12 C-21
- 13 C-22
- 14 Benzo(b)fluoranthene
- 15 Benzo(k)fluoranthene
- 16 Benzo(ghi)perylene

GC-5Amine

95% Dimethyl - (5%) diphenylpolysiloxane

- Bonded and cross-linked phase
- Specially designed for the analysis of amines and other basic analytes
- A special deactivation treatment of the column surface and cross-linking of the phase results in minimal absorption and tailing of basic compounds, including alkylamines, ethanolamines, basic pharmaceuticals, aromatic amines, etc.
- Equivalent selectivity and thermal stability to GC-5 columns

GC-5.625

95% Dimethyl - (5%) diphenylpolysiloxane

- Bonded and cross-linked phase
- Non-polar
- Specifically manufactured to fulfill the level of inertness required by EPA methods for the analysis of semi-volatile compounds - designed for methods 625, 1625, 8270 and CLP protocols
- Inertness and minimum absorption for acidic, basic and neutral compounds
- High temperature limit
- Excellent thermal stability and low bleed

GC-X5MS

Phenyl Arylene polymer

- Bonded and cross-linked phase
- Non-polar
- Preferred column for the analysis of semi-volatile compounds with GC-MS
- Selectivity similar to GC-5
- New generation of column incorporates arylene groups in the polymer structure, which improves thermal stability, reduces bleed level and provides optimal resolution of aromatic compounds
- The manufacturing procedures for this column guarantee its maximum inertness and minimal bleed.
- Quality control test (X5MS) guarantees total inertness and optimal signal/noise ratio for the more active compounds which usually suffer adsorption problems, like 2,4-dinitrophenol, 4 nitroaniline and pentachlorophenol.

GC-XLB (proprietary phase)

ANALYSIS OF BROMINATED FLAME RETARDANTS (Polybrominated Diphenyl Ethers, PBDEs)

Column: GC-XLB
 15m x 0.18mm x 0.072 μ m
 P/N: 10-200205
 Injection: 280°C, Splitless w/Surge: Pulse 40psi @ 0.30min, 50ml/min @ 0.4min
 Oven: 100°C (0.5min) to 320°C (7min) @ 30°C/min
 Carrier: Helium, constant flow @ 2ml/min
 Liner: Gooseneck, Splitless (3mm) w/ Wool
 Detector: MS (SIM)
 Ions monitored: 405.9, 460.6, 483.8, 485.8, 563.9, 643.9, 721.6, 799.7
 Transfer line temp.: 300°C
 Ionization mode: EI
 Sample: 1 μ l Mixture of BDE-MXF (0.2ng on-column) and BDE-209 (5ng on-column)
 from Wellington Laboratories

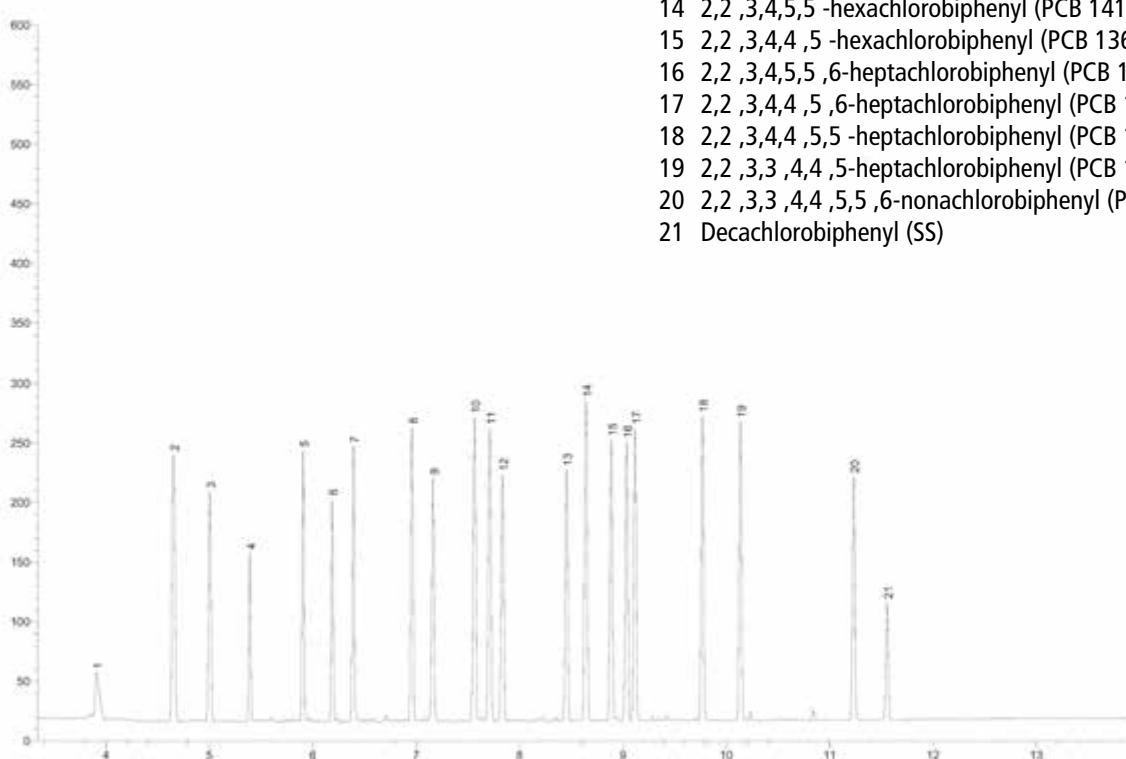

GC-XLB (proprietary phase)

PCBs

Column: GC-XLB
30m x 0.25mm x 0.25 µm
P/N: 10-202014
Injection: 1 µL PCBs St. in Hexane (200ppb each compound),
100ppb 2,4,5,6-Tetrachloro-m-xylene, 100ppb
Decachlorobiphenyl, Splitless (0.75min), 250°C
Carrier gas: H2, constant pressure 20psi (137.8 kPa)
Linear Velocity: 70cm/seg @ 120°C
Oven: 120°C (0.5min) @ 25°C/min to 260°C (2min.) @ 25°C/min to 25°C (5min)
Detector: ECD, 330°C (make up N2 to ml/min)

GC-1301

94% Dimethyl - (6%) cyanopropylphenyl polysiloxane

- Bonded and cross-linked phase
- Intermediate polarity
- Ideal column for analyzing mixtures of acidic and basic compounds with a wide polarity range.
- This column is very useful for the analysis of pesticides and herbicides

Structure of Poly(dimethylcyanopropylphenyl)

GC-G43

94% Dimethyl - (6%) cyanopropylphenyl polysiloxane

- Bonded and cross-linked phase
- Intermediate polarity
- Complies with the specifications of the American (USP) and European (EP) pharmacopoeia for the analysis of residual solvents (OVI) in pharmaceutical products, USP method 467 and EP method 2.4.24
- Guaranteed chemical inertness and low bleed
- Specifically tested for complete separation of the five solvents regulated by USP Method 467. For this analysis, pharmacopoeia recommends the use of a guard column of 5m (P/N 10-201929) to trap the non-volatile impurities in the sample

CHROMAWax-10

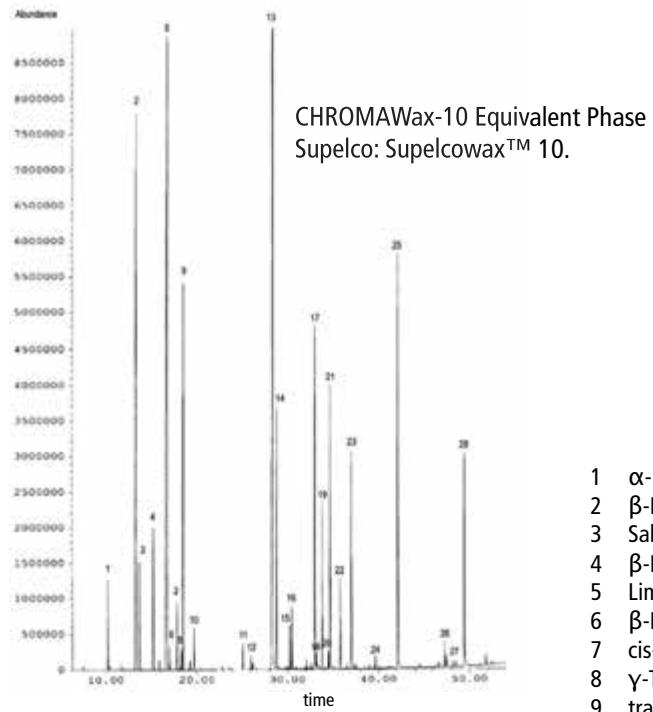

Columns directly equivalent to the SUPELCOWAX™ 10.
Based on the popular Carbowax 20M phase.

- Bonded and cross-linked phase
 - High polarity
 - 100 % Polyethyleneglycol (PEG), interlaced phase and chemically bonded
 - Extended use for the analysis of methyl esters of fatty acids (FAMEs) and analysis of solvents, aromas, alcohols and aromatic compounds in the alimentary and essences industry
 - Wide range of operating temperatures and high thermal stability (35°C-280°C)
 - Compatible with water and methanol injections, providing that these solvents be completely vaporized before reaching the column inlet
 - Column to column reproducibility is guaranteed
 - Column meets USP G16 requirements

NOTE: Column is chemically compatible with water and other injection solvents, but solvents such as methanol and water must be vaporized prior to reaching the column inlet. These solvents should be avoided when using on-column injection. Sensitive to strong inorganic acids.

GC-FFAP

100% Polyethylene glycol, modified with nitrotetraphthalic acid

- Bonded and cross-linked phase
- Designed for analysis of volatile free acids, phenols and glycols
- High thermal stability (250°C)

NOTE: We do not recommend the use of water or methanol when rinsing GC-FFAP capillary columns

GC-FFAP Similar Phases

GC-WAX.DB

(100%) Polyethylene glycol phase- base modified non-bonded.

- Non Bonded Phase
- Symmetrical peaks due to basic deactivation of the Polyethylene glycol (PEG)
- Excellent for analysing basic non-derivatized compounds
- Ideal for separating amines and nitrosamines
- Suitable for EPA Method 607

GC-CRESOL

Proprietary non bonded phase

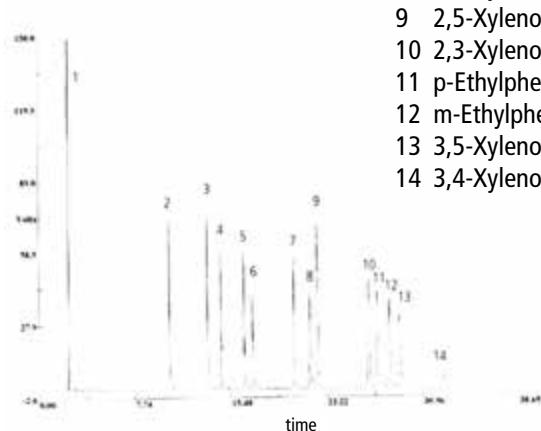

- Highly purified stationary phase
- Column specially designed for analysis of phenolic compounds (phenols, cresylic acids)
- Derivatization of phenolic compounds is not required to obtain required resolution
- Resolves m-cresol/p-cresol and 2,4-xylenol/2,5-xylenol pairs, which are not separated with other columns used for this analysis such as GC-5 and GC-WAX

GC-CRESOL Similar Phase

Varian: CP-CRESOL

MICROBORE CAPILLARY COLUMNS (0.10mm ID)

Microbore Columns (0.10mm ID) can be connected to a conventional chromatograph fitted with a SPLIT/SPLITLESS injector and can reduce analysis time significantly without loss of resolution. The high efficiencies of our microbore capillary columns (~7,000 – 10,000 plates/meter), enable complex mixtures to be resolved using shorter columns. The shorter columns are less expensive, reduce analysis time and result in significant savings for the laboratory.

Benefits and limitations of Microbore columns

Operating Pressure (Gas Flow)

Working pressures are higher with microbore columns which can result in ferrule and septum leaks and problems with leaking syringe plungers. Optimum pressure of the carrier gas flow is low ($H_2 \sim 0.2cc/min$ and $He \sim 0.1cc/min$), which works well with mass detectors since it does not exceed its emptying capacity. Operating microbore columns at below optimum pressures will result in poor performance and resolution.

Sample Capacity

Due to the ID of these columns the sample which can be injected is considerably smaller than with conventional column diameters. Microbore sample capacity is approx. 10 times less than that of a 0.25mm ID column. Therefore the on-column injection should be at least ten times lower for a microbore column.

Injector

Split and splitless injection are recommended with microbore columns. The size of the glass liners are an important factor. Carrier gas flow rates are very low with microbore columns which means 2 to 4mm liners are not suitable due to their large dead volume which results in large peak shapes and subsequent loss of resolution. Therefore, liners with a 0.75 to 1mm ID are recommended and ensure peaks are sharp, well resolved and recovered. Working with small volume liners and microbore columns means great care must be taken with the purity of the sample being injected. Samples must be clean and as free as possible of nonvolatile residues which contaminate the injection system resulting in absorption of analytes, sample decomposition, ghost peaks etc.

Detector

The gas flows of the detector must be optimised when working with microbore columns. It may be necessary to increase the make up gas flow in some detectors in order to minimise its dead volume and enable the correct sweep of the compounds which leave the column at very low flow levels. Since the peaks elute very fast and are very narrow (the peak widths are generally less than 1 s) it is necessary to work at very high speeds on the electrometer and with fast integration so that the quantification of the peaks is correct. The small volume of these columns means that the quantity of stationary phase deposited in them is very small compared to a conventional column. This, along with the low flow levels with which it works, causes the bleed level (proportional to the quantity of the phase and flow) to be minimal, even at high temperatures, thus favoring the signal/noise ratio and contributing to the detectors not getting contaminated.

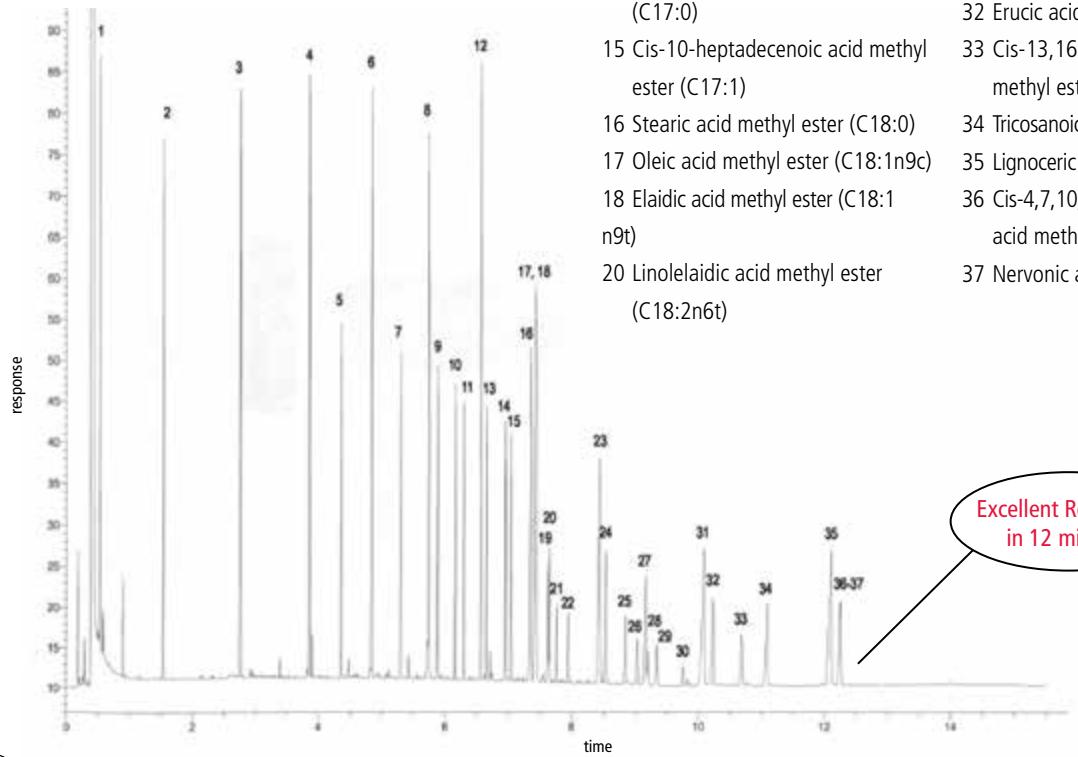

Microbore Columns 10μm

Phase	ID	Length (m)	Film (μm)	Temp Limits (°C)	Cat. No.

CUSTOM MADE CAPILLARY COLUMNS

We can offer bonded and non bonded custom capillary columns manufactured to your own specifications.

Simply advise us of the column length, ID, phase and film thickness you require and we will do the rest.

Many less common phases which we can also offer as custom columns for methods which are described in official methods or in scientific bibliography include -

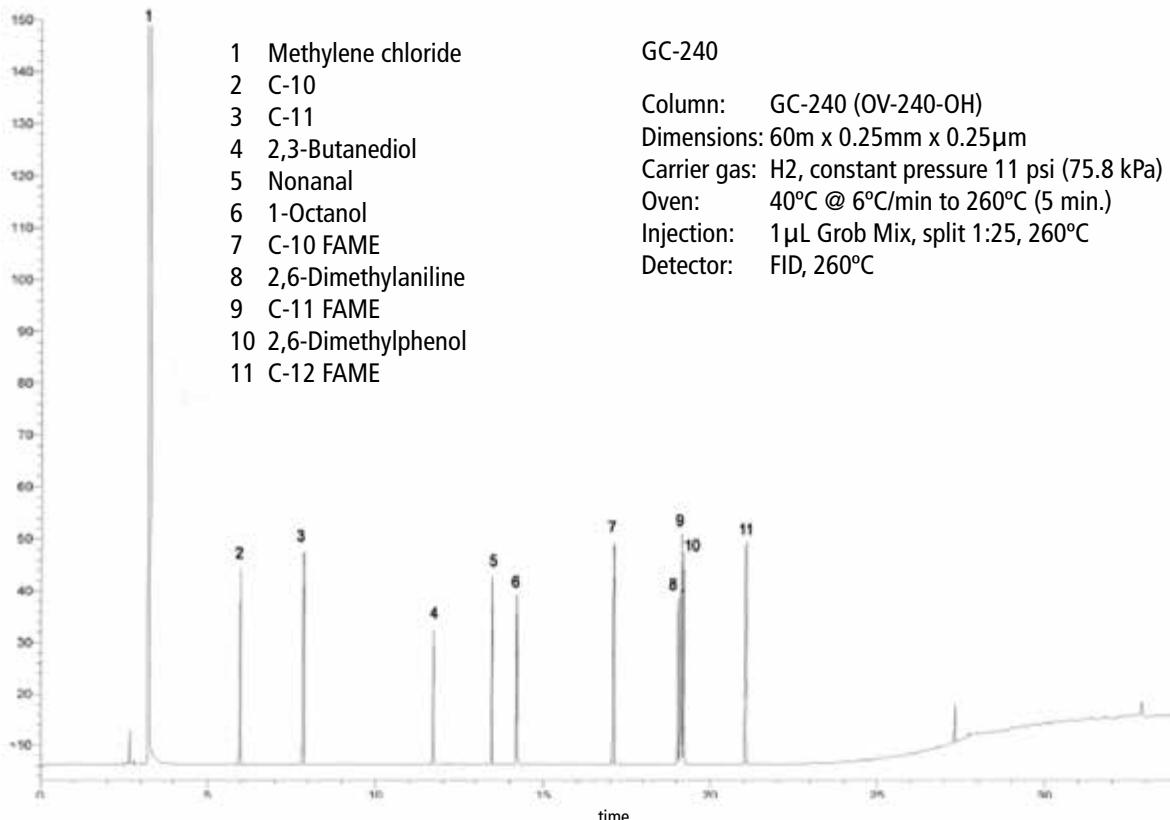

- GC-101 100% polydimethylsiloxane phase (silicone fluid)
- GC-SE30 100% polydimethylsiloxane phase
- GC-SE52 5% phenyl - 95% dimethylpolysiloxane phase
- GC-SE54 5% phenyl - 1% vinyl - 94% dimethylpolysiloxane Phase
- GC-20M 100% polyethylene glycol (Carbowax 20M) phase

FOR PHASES NOT INCLUDED IN OUR STANDARD LIST, PLEASE CONTACT OUR SALES DEPARTMENT TO DISCUSS YOUR PARTICULAR REQUIREMENTS.

INVERSE GAS CHROMATOGRAPHY COLUMNS

Greyhound supply capillary columns for inverse gas chromatography, used for the characterisation of polymers. We can supply custom made silica columns coated with your polymer, please contact our sales department to discuss your requirements.

PLOT COLUMNS

PLOT (Porous Layer Open Tubular) columns are used for the separation of compounds which are gases when at room temperature. Greyhound Chromatography offers an extensive selection of PLOT columns for the analysis of volatile polar compounds, fixed gases, low molecular weight hydrocarbons and reactive analytes e.g. sulfur gases, hydrides and amines. Our range of PLOT columns are available with 0.25mm, 0.32mm and 0.53mm IDs, making column selection very simple.

GC Phase	Composition	Polarity	Temp	Phase Cross Reference
GC-PLOT Molesieve	Molecular Sieve 5Å	N/A	-80 to 300°C	HP-PLOT Molesieve, CP-PLOT MolSieve

GC-PLOT MoleSieve

- Molecular Sieve, Zeolite, 5Å
- Ideal PLOT column for the analysis of permanent gases
- Thick and thin coatings available for a range of separations, e.g. Ar/O₂ separation at 35°C, O₂/N₂ within 15 sec.
- Completely immobilized coating ensures a smooth baseline and is ideal for methods using valve switching applications
- Recommended column for the analysis of fixed gases from hydrocarbon streams
- Elution order, H₂, He, Ne, O₂, N₂, CH₄, CO - Regeneration of performance from water/CO₂ adsorptions at 250°C for 3hr
- ASTM recommended phase
- Used for analysis of noble gases, air from methane, fuel cells, etc
- Often used with other PLOT columns for fixed gas separations from sample matrix

GC-PLOT Al2O3/KCL

- Least polar aluminum oxide phase deactivated with KCl
- Good baseline separation of most C1 to C10 hydrocarbons
- Low retention of olefins relative to comparable paraffins
- Minimum surface adsorption of dienes and halocarbons
- ASTM recommended phase

Analysis of impurity in ethylene using a GC-PLOT Al2O3 column at 100°C. The sample is 99% ethylene and 1% acetylene.

Low levels of methane and ethane impurities (1ppm) are detected at high temperature 100°C, with good peak separation.

GC-PLOT Q

- Divinylbenzene polymer particle, non polar, similar to PoraPak Q
- Immobilized coating giving a smooth baseline ideal for valve switching and liquid sample introduction at low temperatures
- Maximum temperature limit up to 280/300°C
- Baseline separation of Air, CO₂, water, sulphur gases, hydrogen chlorine, ammonia/light amines from hydrocarbons such as refinery streams, natural gas, and engine exhaust
- Excellent separation of C1 to C3 isomers, good separations of C3 to C12, halocarbons
- Excellent inertness and long column lifetime when analysing water/alcohol samples, a good secondary choice to a wax column for alcohol analysis
- Excellent tolerance to strong acid/base samples without affecting retention time
- Good anti-oxidation at 280°C and fast column regeneration back to original performance
- Good choice for analyzing low level solvent residues from a wide range of samples, such as headspace, aqueous, or organic solutions
- Preferred column for residue analysis in petroleum, pharmaceutical, environmental and chemical weapons detection industries
- Preferred column for analysis of polar compounds including oxygenates from hydrocarbon streams: natural gas, refinery gas, dienes, ethylene, propylene

- 17 N-Pentane

GC-PLOT U

Divinylbenzene and Ethylene glycol dimethacrylate co-polymer particle, polar, similar to traditional Porapack U.

- Immobilized coating giving a smooth baseline ideal for valve switching and liquid sample introduction at low temperatures
- Improved separation and selectivity of Air, CO₂, water, sulphur gases, hydrogen chlorine, ammonia/light amines from hydrocarbons
- Symmetric water peak shape, water elutes after C3
- Excellent separation of C1 to C3 isomers, good separations of C3 to C12 halocarbons
- Excellent inertness and long column life with water/alcohol samples
- Excellent tolerance to strong acid/base samples without affecting retention times
- Good choice of column for analyzing low level solvent residues from a wide range of samples, such as headspace, aqueous, or organic solutions
- Preferred column for residue analysis in the petroleum, pharmaceutical, environmental and chemical weapon detection industries

GC-PLOT GasPro

- Proprietary Silica based phase
- Very inert to a wide range of gases including sulfur gases and Freons, symmetrical peak shapes
- Completely immobilized coating ensures a smooth baseline and is ideal for methods using valve switching applications
- Ideal PLOT column for GC/MS applications - no particles
- Preferred column for the analysis for sulfur gases from hydrocarbon streams and air
- Separation of CO and CO₂
- No influence of water on retention times
- Ideal for high-throughput laboratories and online process applications
- ASTM recommended phase

GUARD COLUMNS (RETENTION GAP)

A capillary guard column is a length of 1-10 meters of deactivated fused silica tubing attached to the front of the capillary column. Deactivated fused silica tubing does not contain any stationary phase, however, the surface is deactivated to minimize solute interactions. The tubing is attached to the column with a suitable union or universal press fit connector. Usually the diameter of the guard column is the same as the analytical column. If the tubing sizes are different, it is better to have a larger diameter guard column than a smaller one.

Guard columns trap non-volatile residues and prevents them from collecting on the inlet of the analytical column resulting in longer column life. This greatly reduces the interaction between the sample and the residues as the guard column does not retain the solutes (because it does not contain any stationary phase). Also, the residues do not coat the stationary phase which often results in poor peak shapes. Periodically it is necessary to trim the guard column due to the build-up of residues. Guard columns of 5 to 10 meters allow for considerable trimming before it has to be replaced. Abnormal peak shapes usually indicates that the guard column requires trimming or changing. Various guard columns are available with different polarities, it is important to match the polarity of the solvent with the polarity of the surface deactivation.

NON POLAR

Methyl deactivated tubing, suitable for pentane/hexane and other non polar solvents.

MEDIUM POLAR

Phenyl-methyl deactivated tubing, (USP 467) suitable for methylene chloride, hexane, toluene and a wide range of similar solvents.

POLAR

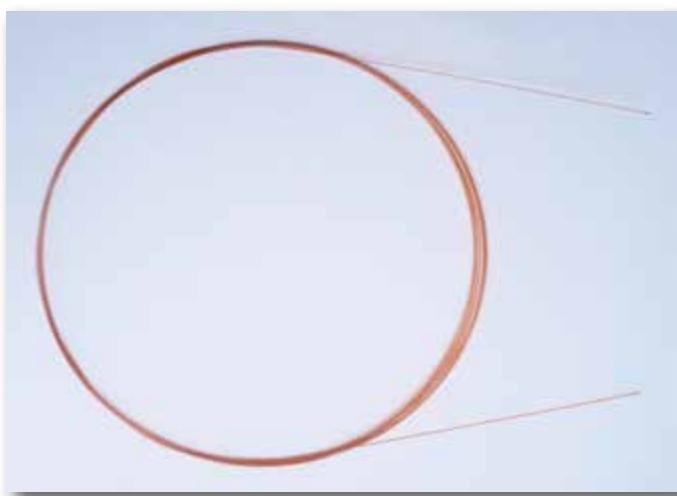

Polyethylene glycol deactivated tubing, suitable for methanol, water and a wide range of similar polar solvents.

BASE-DEACTIVATED

Proprietary deactivation of the tubing, suitable for analysis of amines and other basic compounds.

HYDROSAFE

Proprietary deactivation of the tubing making it suitable for water direct aqueous injections.

STAINLESS STEEL CAPILLARY COLUMNS (SilCol)

Greyhound 'Q-Cap' Stainless Steel Capillary Columns are manufactured using our SilCol stainless steel tubing. The internal surface is specially treated which results in column tubing with a chemical inertness comparable to that of fused silica. SilCol tubing is currently available with a 0.53mm internal diameter.

SilCol stainless steel capillary columns can be used at higher temperatures (430°C.) than fused silica columns (usually ~ 360°C.) The reason is that the polyimide resin becomes brittle after repeated use at high temperatures, this does not happen with SilCol stainless steel capillary columns. SilCol stainless steel capillary columns can be wound in small diameter coils and will not break under stress.

SilCol stainless steel capillary columns are ideal for use in locations where the possibility of breakage is higher, e.g. process G.C., field instruments and GCs in portable instruments where the small ovens require tightly wound columns. SilCol stainless steel capillary columns are available with most of our popular stationary phases, please call our sales office to discuss your requirements.

To order a SilCol stainless steel capillary column, add the suffix -SC after the corresponding part number for the FSOT column in the catalogue eg:

A 10m x 0.53mmID x 2.65um SilCol Column coated with GC-2887 for SimDist analysis

Cat. No with FSOT Capillary Tubing: 10-202045

Cat. No. with SilCol Stainless Steel Tubing: 10-202045-SC

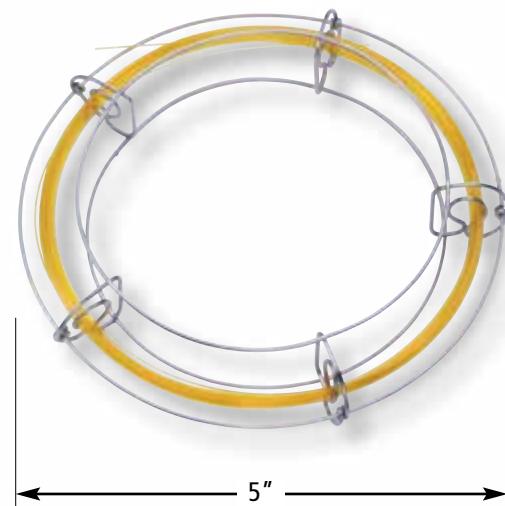

CAPILLARY COLUMNS FOR AGILENT GC 6850

Greyhound 'Q-Cap' Capillary Columns are available wound onto a 5 inch cage to fit the Agilent GC6850 chromatograph.

To order a column on a 5 inch cage simply add -5 to the standard catalogue number

e.g. 30m x 0.25mm x 0.25um coated with GC-5 phase

Column Material	Cat. No.
FSOT Column on 7 inch cage	10-200349
FSOT Column on 5 inch cage	10-200349-5
SilCol Column on 7 inch cage	10-200349-SC
SilCol Column on 5 inch cage	10-200349-5-SC

CAPILLARY COLUMN CONNECTIONS

Universal Quartz Glass Fused Silica Connectors

Our quartz connectors will join columns from 0.1 to 0.53mmID. To make a connection, cut the capillary column with a ceramic column scribe, be sure the end is cut squarely. Insert the column into the appropriate leg of the connector to make a snug fit. Heat in the GC oven under carrier gas flow for one hour at 250°C, to fuse the column's polyimide coating to the wall of the union. For a stronger physical attachment, we recommend using polyimide sealing resin.

Used to:

- Join columns from 0.1mm to 0.53mm ID
- Connect a guard column to an analytical column
- Connect a capillary column to a transfer line
- Repair a broken capillary column

Cat. No.	Description	Unit
11-100000	Universal Quartz Fused Silica Connector	Pk/5
11-100002	Universal Quartz Fused Silica Y Connector	Pk/1

CAPILLARY COLUMN CONNECTIONS

SilTite Mini Unions

For fused silica capillary columns. Glass lined for inertness. Low thermal mass.

Why choose SilTite Unions?

SilTite unions use a unique metal ferrule specifically designed for connecting fused silica GC columns and tubing to mass spectrometer interfaces and injectors. Once fitted, SilTite ferrules provide a continuous leak free connection without the need to re-tighten the nut after a few temperature cycles.

Their performance and cost effectiveness also makes them ideal for connecting GC columns to injectors and atmospheric detectors.

- Eliminate leaks
- Never need re-tightening, even after temperature cycling
- Ferrule remains permanently fixed to the column but does not adhere to the SilTite nut
- No contamination from Vespel or Graphite materials – 100% metal
- Ideal for high pressure applications
- Also available for injector interfaces
- >500°C maximum temperature

1st Column ID	2nd Column ID	Pack Contents	Cat. No.
0.1-0.25mm	0.1-0.53mm	1 union, 2 nuts & 5 Ferrules (0.1-0.25mmID)	073550
0.32mm	0.32-0.53mm	1 union, 2 nuts & 5 Ferrules (0.32mmID)	073551
0.45-0.53mm	0.45-0.53mm	1 union, 2 nuts & 5 Ferrules (0.45-0.53mmID)	073552
Replacement SilTite Mini Union Nuts *	Pk/5		073553

*SilTite nuts must be used with SilTite ferrules

CAPILLARY COLUMN FERRULES

Vespel Ferrules

- 100% high-temperature polyimide • Stable to 350°C • Precision-drilled ID • Durable, leak-tight

Capillary Column Ferrules	For Capillary Size	Part No.
1/16" to 0.3 mm	0.10 - 0.18 mm ID	50-100104

1/16" to 1/16"		50-100112

Short ferrule for Agilent inlet systems; 4890, 5890 and 6890

1/16" to 0.4 mm	0.25 mm ID	50-100100
1/16" to 0.5 mm	0.32 mm ID	50-100101
1/16" to 0.8 mm	0.53 mm ID	50-100102

Graphite Ferrules

- High-purity Graphite, preferred quality for capillary GC use • Stable to 450°C
- Precision formed, superior finish to conventional graphite ferrules
- Reusable if not over tightened

Capillary Column Ferrules	For Capillary Size	Part No.
1/16" to 0.4 mm	0.25 mm ID	50-100010
1/16" to 0.5 mm	0.32 mm ID	50-100012
1/16" to 0.8 mm	0.53 mm ID	50-100013
1/16" to 1.0 mm	0.65 mm ID	50-100014
1/16" to 1.2 mm	0.75 mm ID	50-100015
1/16", 2-hole, 0.4 mm ea	0.25 mm ID	50-100009
1/16", 2-hole, 0.5 mm ea	0.32 mm ID	50-100011
1/16" to 1/16"		50-100052

Short ferrule for Agilent inlet systems; 4890, 5890 and 6890

1/16" to 0.4 mm	0.18 mm ID	50-100000
1/16" to 0.5 mm	0.25-0.32 mm ID	50-100002
1/16" to 0.8 mm	0.53 mm ID	50-100004
1/16" to 1.0 mm	0.53-0.65 mm ID	50-100006
1/16" to 1/16"		50-100008

Speciality Ferrules

0.5 mm ID (M8 nut), for Thermo Finnigan (formerly CE) 10/pk	50-100003
0.8 mm ID (M8 nut), for Thermo Finnigan (formerly CE) 10/pk	50-100005
Cup Ferrule for Thermo, 0.25 mm ID (M4 nut), 10/pk	50-100040
Cup Ferrule for Thermo, 0.35 mm ID (M4 nut), 10/pk	50-100041
Cup Ferrule for Thermo, 0.45 mm ID (M4 nut), 10/pk	50-100042
Cup Ferrule for Thermo, 0.8 mm ID (M4 nut), 10/pk	50-100043

CAPILLARY COLUMN FERRULES

Vespel / Graphite Ferrules

- 60% / 40% Vespel/Graphite blend - provides good sealing properties and ease of use
- Stable to 400°C.
- Recommended for GC/MS interface applications
- Reusable, preferred for high pressure and vacuum applications

Capillary Column Ferrules	For Capillary Size	Part No.
1/16" to 0.3 mm		50-100145
1/16" to 0.4 mm	0.25 mm ID	50-100147
1/16" to 0.5 mm	0.32 mm ID	50-100149
1/16" to 0.8 mm	0.53 mm ID	50-100150
1/16" to 1.0 mm	0.65 mm ID	50-100151
1/16" to 1.2 mm	0.75 mm ID	50-100171
1/16", 2-hole, 0.4 mm ea	0.25 mm ID	50-100146
1/16", 2-hole, 0.5 mm ea	0.32 mm ID	50-100148
1/16" to 1/16"		50-100152

Short ferrule for Agilent inlet systems; 4890, 5890 and 6890

1/16" to 0.3 mm	0.10 mm	ID 50-100140
1/16" to 0.4 mm	0.25 mm	ID 50-100141
1/16" to 0.5 mm	0.32 mm	ID 50-100142
1/16" to 0.8 mm	0.53 mm	ID 50-100143

CAPILLARY COLUMN NUTS

Capillary Column Nuts for Agilent 5890 / 6890 GCs

Description	Similar to Agilent Part #	Qty	Part No.
For use with Agilent "short" style ferrules			
Stainless Steel Capillary Column Nut	5181-8830	Pk/2	11-100010
Brass Capillary Column Nut	5181-8830	Pk/2	11-100012

For use with standard 1/16" ferrules

Stainless Steel Capillary Column Nut	05921-21170	Pk/2	11-100014
Brass Capillary Column Nut	05921-21170	Pk/2	11-100016

Capillary Column Nuts for Agilent 6850 GCs

Description	Similar to Agilent Part #	Qty	Part No.
Capillary Column Nuts for Agilent 6850 GCs	5183-4732	Pk/2	11-100018

ACCESSORIES

Capillary Column Washing Reservoir

Description	Pack Size	Part No.
Washing Reservoir - 10ml	1	0625026

Replacement Parts

TCS Pre-drilled Septa (4mm)	5	0418490
PTFE 1/16" Sealing Ring	20	072650

Capillary Column Washing Reservoir

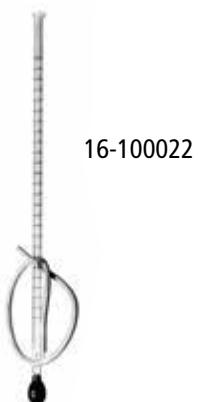

- Removes column contamination through solvent washing
- Used to regenerate a contaminated column

Soap Bubble Flow Meters

Simple to use just measure the time it takes a soap film to travel between two calibration marks with a stopwatch. Soap Bubble Flow Meters are made from borosilicate glass. All are graduated in milliliters, except the 50mL flow Meter, which has marks at 0,25 and 50 mL, and the Triple Stage Flow Meter. Flow Meters are supplied with a rubber bulb for the soap solution, rubber tubing, and an instruction sheet. Snoop® liquid leak detector can be used as the bubble solution (not included).

Triple Stage Flow Meter - this uses three different volume regions (1 mL - 10 mL - 100 mL) that allow measurement of gas flow rates from 0.5 to 500 mL/min. It comes

Description	Part No.
1 mL Soap Bubble Flow Meter	16-100020
10 mL Soap Bubble Flow Meter	16-100021
25 mL Soap Bubble Flow Meter	16-100022
50 mL Soap Bubble Flow Meter	16-100023
Triple Stage Flow Meter	16-100024
Ring Stand	16-100025
Large Clamp	16-100026
Replacement Bulb, for 1 or 10 mL	16-100027
Replacement Bulb, for 25 mL	16-100028
Replacement Bulb, for 50 mL	16-100029
Magnetic Holder (not for 1 mL size), 2/pk	16-100030
Snoop Leak Detector	16-100031
Stopwatch, Digital	16-100032

16-100022

ACCESSORIES

Capillary Care Kit

Convenient kit specifically designed to help install and maintain capillary columns.

Each kit includes :

- Nylon Brushes - 1/8", 3/16" and 1/4" for cleaning injection port liners
- Magnifier with built-in light
- Steel ruler - 15cm
- 3 Column Scribes - for cleanly-cut columns
- 2 Universal Unions - for joining broken capillary columns or connecting guard columns
- Single ended pin-vice - for holding drill bits
- 3 Drill bits - 0.4mm, 0.5mm, and 0.8mm
- Pipe cleaners - 5 each, 1/8" and 1/4" OD
- Open-end wrench - 1/4" & 5/16"
- Slide-Lok tweezers - for holding small items, 'spacing' the column proper distances into the injection port etc.
- High temperature string - (400°C.) 25ft
- Ferrule Remover

Cat. No.	Description	Unit
11-100008	Capillary Care Kit	Ea

Column Scribe

Cat. No.	Description	Unit
11-100006	Column Scribe	Pk/10

Polyimide Sealing Resin

Permanently seal fused silica columns to capillary column connectors to eliminate leaks or premature separation of the column.

Also useful as a high temperature glue.
Maximum operating temperature is 300°C.

Cat. No.	Description	Unit
11-100004	Polyimide Sealing Resin	10gm

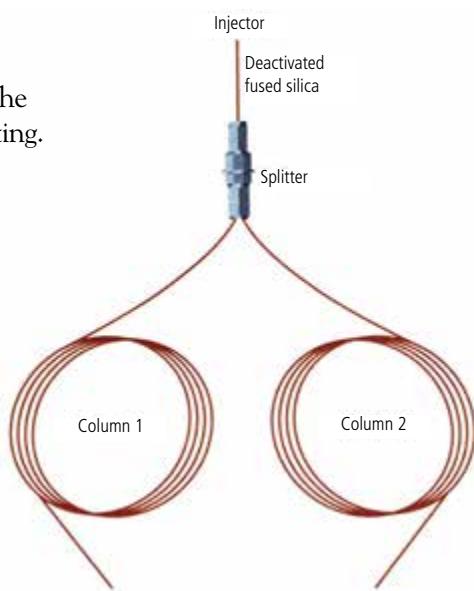

CAPILLARY COLUMN SPLITTERS

Fixed Inlet Splitter for Capillary Columns

When using the fixed inlet splitter for splitting from the injector to two columns, the capillary columns must have the same length and ID to achieve equal sample splitting. There are 3 kits available to suit 0.25, 0.32 and 0.45-0.53mm ID capillary columns, which are supplied with all unions and ferrules needed for installation.

- splits an injection between two capillary columns
- fixed split ratio
- splitter is supplied complete with tubing, ferrules and nuts required for installation
- excellent for confirmation of retention data (e.g. pesticide analysis)
- inert glass lined tubing (GLT) flow path
- low dead volume
- can be used for all capillary columns (0.1-0.53mm ID)

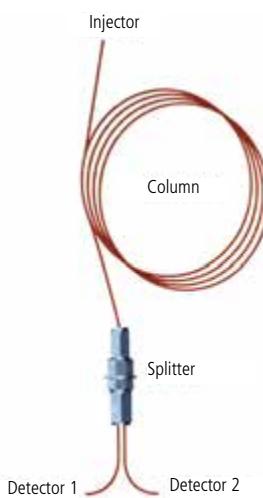

When using the fixed inlet splitter for splitting from the injector to two columns, the capillary columns must have the same length and ID to achieve equal sample splitting. There are 3 kits available to suit 0.25, 0.32 and 0.45-0.53mm ID capillary columns, which are supplied with all unions and ferrules needed for installation.

Description	Column ID	Pack Size	Part No.
Inlet Capillary Column Splitter	0.1-0.25mm	1	123632
	0.32mm	1	123633
	0.45-0.53mm	1	123634
Replacement Ferrules	0.1-0.25mm (2-hole ferrule)	10	072662
	0.32mm (2-hole ferrule)	10	072664
	0.45-0.53mm (1-hole ferrule)	10	072655

Fixed Outlet Splitter for Capillary Columns

- designed for splitting the flow from one capillary column to two detectors.
- glass lined tubing (GLT) splitter union for inertness
- splitter is supplied complete with tubing, ferrules and nuts required for installation
- can be used for 0.1-0.32mm ID capillary columns
- for an outlet splitter for 0.53mm ID columns,

Description	Column ID	Pack Size	Part No.
Outlet Capillary Column Splitter	User-determined Spilt Ratios*	1	123630
	1:1**	1	1861460
	1:5**	1	1861461
	1:10**	1	1861462
Replacement Tubing	1:1**	2	18614600
	1:5**	2	18614610
	1:10**	2	18614620
Replacement 2-Hole Ferrules	0.1-0.25mm ID Column	10	072662
	0.32mm ID Column	10	072664

*Includes 5 meter length of 0.22mm ID deactivated fused silica tubing.

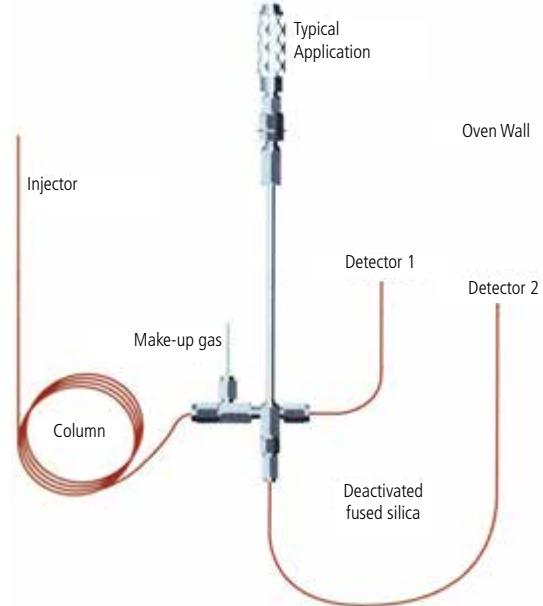

**Includes fused silica tubing pre-fused into a 2-hole ferrule for preset split ratios.

CAPILLARY COLUMN SPLITTERS

Variable Outlet Splitter for Capillary Columns

- regulates flow from one capillary column to two detectors
- make up gas tee piece built into the valve to increase flow velocity thus eliminating potential dead volume problems
- detector sensitivity is maintained
- valve control is located outside the GC oven while all parts of the flow path are inside the oven eliminating condensation problems

Description	Part No.
Capillary Variable Outlet Splitter	1236291

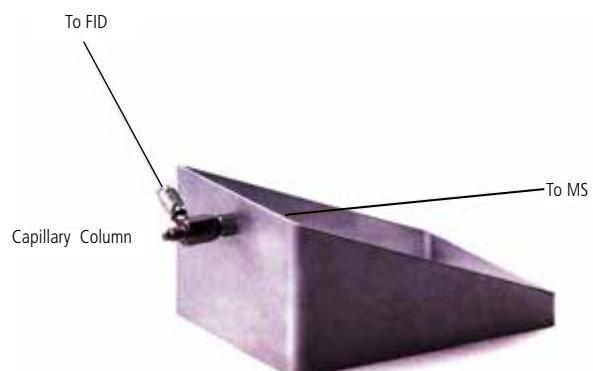

MS / FID Splitter Kit

MS / FID Splitter Kit Advantages

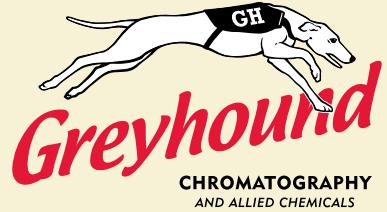

- splitter kit is specifically designed for splitting the flow between MS and FID detectors
- kit is supplied with a complete set of restrictors, nuts, ferrules, support bracket and pre-cut fused silica tubing
- extremely low dead volume
- inert glass lined tubing (GLT) tee piece
- can be used for all capillary columns (0.7-0.53mm ID)
- 1:1 split ratio

Description	Part No.
MS / FID Splitter	123710
